JPlay configuration for use with the Naim DAC-V1

JPlay

JPlay is a licensed plugin for any ASIO capable Windows playback application. Typically it would be used with Foobar2000 or JRiver Media Centre (instructions for integration of JPlay with these applications may be found on the JPlay site) however it should be noted that these applications already support bitperfect playback of audio when properly configured for use with our DAC-V1 product.

It should be noted that JPlay is very machine specific - the settings shown here should be used as a guide and may not suit all machine configurations.

JPlay is a paid-for application but does allow for license-free evaluation. Naim Audio Ltd have no affiliation or connection with the authors of JPlay and these instructions do not comprise any specific recommendation for the use of JPlay with Naim products in addition to or in preference of any other bitperfect capable application.
